

The scatter plot displays the adjusted R-squared values for different numbers of predictors. The x-axis represents the number of predictors (0 to 18), and the y-axis represents the adjusted R-squared value (0.0 to 0.8). A dashed horizontal line is drawn at y = 0.0. The data points show a clear upward trend, indicating that the adjusted R-squared value increases as the number of predictors increases. The values start near 0.0 for 0 predictors and reach approximately 0.7 for 18 predictors.
